

Introducing a New Solution for Fast Relief from Adult Flies: PT® Alpine® Pressurized Fly Bait

Flies in and around commercial food establishments not only annoy customers, but present a major threat to the food and beverage industry.

BASF is introducing a new bait product to help you quickly kill flies. PT® **Alpine® Pressurized Fly Bait** is a ready-to-use formulation that's fast-acting and convenient to apply.

With the active ingredient dinotefuran, PT **Alpine Pressurized Fly Bait** complements existing fly solutions by providing a new layer of fly control

for problem areas and areas where other methods fall short.

It can be used in residential settings, especially in and around garbage containers, for outdoor events to prevent fly problems around trash containers and in commercial recycling and trash areas. It is a great product for food handling accounts and can be used as removable bait placements in food/feed areas or as a direct spray to surfaces in nonfood/feed areas indoors and outdoors that may attract fly activity.

As a fast-acting bait-spray, it's a versatile fly product that can be used in both residential and commercial settings and can be applied as area, band or spot treatment applications. The formulation applies fast with no mess and dries clear, leaving no odor.

For the most effective fly management, pair PT **Alpine Pressurized Fly Bait** with insect light traps, such as **Vector® Plasma®**, **Vector® Plasma® One®** or **Vector® Classic®** for monitoring of results and fly population reduction.
